Education

GLS University

Bachelor of Engineering in Computer Science

August 2023 – May 2027

Ahmedabad, Gujarat

Achievements

Finalist – Meta PyTorch × OpenEnv Hackathon × Scaler School of Technology

April 25–26, 2026

Team AI Kalesh | Project: GlobeFlowAI | Certificate of Achievement

- Selected among the top 800 finalist teams out of 31,000+ participants globally, advancing to the second round held offline on campus.
- Built GlobeFlowAI – an OpenEnv-compliant RL environment for AI-driven multi-jurisdiction employee relocation workflows, evaluated by Meta and Scaler judges.

Projects

Multi-Modal Satellite Intelligence System | *Python, PyTorch, ResNet18, Streamlit* | [Demo](#)

2026

- Built a deep learning system fusing satellite imagery with geographic (lat/lon) and temporal (month) metadata for earth observation, with direct relevance to ISRO-grade remote sensing applications.
- Designed a multi-task architecture with 3 output heads: 10-class land use classification (97.5% accuracy), vegetation health regression (RMSE 0.20), and environmental risk binary classification (F1 0.70).
- Implemented Cyclic Time Encoding (sin/cos) for seamless month transitions and integrated Grad-CAM for explainability and NDVI approximation from RGB data.
- Deployed as an interactive Streamlit dashboard supporting satellite image upload, metadata sliders, and real-time AI predictions with heatmap overlays.

GlobeFlowAI | *Python, FastAPI, GRPO+LoRA, Docker, HuggingFace Spaces* | [Demo](#)

2026

- Designed a long-horizon, partially-observable RL environment for AI agent training on complex multi-jurisdiction employee relocation – spanning 6 departments, 12 documents, and 3 country rule-sets.
- Built 4 tasks testing distinct agent competencies: rule-following (Germany), country differentiation (Singapore), multi-jurisdiction conflict resolution (Germany + UAE), and mid-episode regulatory crisis recovery.
- Implemented a gaming-hardened shaped reward function with per-step progress bonuses, weighted milestones, rule-violation penalties (−0.30), and parsimony penalties (−0.03/action) to distinguish efficient from eventual solvers.
- Training a GRPO+LoRA reference agent on rollouts across all 4 tasks; random policy scores below 0.25 on all tasks confirming environment non-triviality; deployed via Docker on HuggingFace Spaces.

Medicare – AI Health Assistant | *Flutter, FastAPI, HuggingFace, PostgreSQL, AWS S3*

2026

- Built a production-ready end-to-end AI healthcare platform connecting Patients, AI Engine, Doctors, and Admins with role-based access control (RBAC) via Supabase Auth.
- Integrated a HuggingFace Transformer NLP model for symptom-based disease prediction with doctor-in-the-loop verification before prescription delivery.
- Developed three Flutter applications (Patient, Doctor, Admin) with a Python FastAPI backend, PostgreSQL on Supabase, and AWS S3 for PDF prescription generation and storage.
- Configured CI/CD pipelines via GitHub Actions for automated deployment to AWS EC2.

Technical Skills

Languages: Python, TypeScript, Dart, SQL

AI / ML: PyTorch, ResNet18, HuggingFace Transformers, Scikit-learn, Multi-task Learning, Grad-CAM, NLP

Frameworks & Tools: FastAPI, Flutter, Streamlit, Docker, GitHub Actions, uvicorn

Cloud & Databases: AWS S3, AWS EC2, HuggingFace Spaces, PostgreSQL, Supabase, Vercel

Libraries: NumPy, Pandas, OpenCV, Matplotlib, Pydantic v2

Certifications

Microsoft AI & ML Engineering Professional Certificate

2026

Coursera – [Verify Certificate](#)

Microsoft

IBM Machine Learning Professional Certificate

2026
