■ PROBLEM STATEMENT

Fragmented Event Management

Registration, attendance, judging, scoring, certificates, and event analytics are handled through separate or manual processes, making event management inefficient and difficult to coordinate.

Poor Coordination Between Stakeholders

Students, volunteers, judges, and organizers have different requirements, but there is no single platform connecting their activities and maintaining a common source of event data.

Manual and Time-Consuming Check-In

Verifying student attendance manually creates queues, consumes volunteer time, and can result in duplicate or inaccurate attendance records.

Inefficient Judging and Scoring

Judges often depend on manual evaluation and calculations, which can lead to inconsistencies, calculation errors, and difficulty managing multiple teams.

Lack of Real-Time Tracking

Students and organizers lack a centralized system to track registrations, check-in status, participation points, scores, rankings, and event performance in real time.

PROPOSED SOLUTION

Unified Campus Event Platform

Develop a single platform that connects students, volunteers, judges, and organizers, allowing the complete event process to be managed from one system.

QR-Based Registration & Check-In

Provide students with digital QR tickets and enable volunteers to scan and verify them instantly, making attendance faster, more accurate, and reducing duplicate entries.

Digital Judging & Automated Scoring

Provide judges with a structured evaluation interface where they can score teams based on predefined criteria, while the system automatically calculates total scores and reduces human errors.

Real-Time Tracking & Analytics

Provide students and organizers with real-time information about registrations, attendance, participation points, scores, rankings, and overall event performance.

Automated Rankings & Certificates

Use the collected participation and evaluation data to generate leaderboards and simplify certificate management, reducing the organizers' manual workload.

WORKFLOW

TECHNOLOGIES & TOOLS

Frontend

- FLUTTER
- DART

Database

- MySQL
- SQLAlchemy

Backend

- Python
- FastAPI
- uvicorn

Development Tools

- VS Code
- Android Studio
- Git

Assumptions:

- Reliable internet connectivity
- Unique user identities
- Valid event registrations
- Role-based access
- Predefined judging criteria

Challenges:

- Handling high concurrent users
- Preventing duplicate QR check-ins
- Managing unstable network connectivity
- Protecting user data
- Ensuring fair judging

Future Scope:

- Offline QR scanning
- AI-powered analytics
- Automated certificates
- Push notifications
- Advanced leaderboards
- College ERP integration
- Support for inter-college events

THANK
YOU
